SANIWARE WAFER VALVE #90043

The wafer valve described above is lubricated with silicone grease during manufacture, and well tested prior to shipping. The complete self-contained plumbing system is further tested after final installation in your fine Silver Streak travel trailer.

As with all moving parts a frequent lubrication is strongly recommended, and this can be done with vegetable oil or shortening, usually readily at hand in your kitchen. Simply apply the oil to the Wafer Valve shaft after dumping, or occasionally when the valve is permanently left in an open position during extended trailer park visits.

This will insure ease of operation and the long life for which the valve was designed.
